## ***Product Note***

### **High Sensitivity Wi-Fi Antenna**

IDEAL INDUSTRIES announce the introduction of a High Sensitivity Wi-Fi Antenna for LanXPLOERER PLUS and LanXPLOERER PRO.

This antenna, which simply plugs into the USB port, extends the Wi-Fi capability of the tester by allowing it to connect to weaker or more distant Access Points. The existing internal Wi-Fi antenna is not affected and can still be used to connect to stronger Access Points.

The software required to support the new antenna is included in the release 1.0.34 and above, so units equipped with this release do not require any change. Older units must be updated to the current release in order to benefit from the new antenna.

The antenna is now included as a standard part of the LanXPLOERER PLUS and PRO SKUs (Basic and PREMIUM) and all units of these SKUs shipped from now on will include this part.

The antenna is also available as an accessory, to upgrade existing units or as a replacement for lost or broken parts.

All of the relevant user and marketing documentation for LanXPLOERER has been updated to reflect the change. New versions of the documents can be downloaded from the Public section of the Sales Information Database (SID).
